| Burette - use to accurately measure the volume of liquid needed in a reaction <br> Rinse the burette with some of the solution that scale you are going to use in your titration. Don't use water! <br> Don't forget to check that there are no air gaps below the tap - drain some of the liquid through until all air has gone! | Burette Scales - read to the bottom of the meniscus - you can read to 0.05 mL (half way between the 0.1 mL divisions. Eye is level with the bottom of the curve. Some say you can read to 0.02 mL with care and <br> Eye is too low in the first picture and too high on the third. The middle gives correct reading of $25.65(\mathrm{~mL})$ | Example results table - the volume delivered (the titre) is the difference between the last scale reading and the first (initial) scale reading. Answers must not be negative! <br> Example <br> Record volumes to 2 decimal places. Your initial reading does not have to start at 0.00 mL <br> You are aiming for $\mathbf{3}$ results within 0.20 mL of each other. It should be possible to get them within $\mathbf{0 . 1 0}$ mL . These will then be classed as concordant results. You use concordant results to calculate the average titre. |
| :---: | :---: | :---: |
| Pipette - used to accurately measure a volume of solution and deliver into a conical flask. <br> - Volumes measured are usually 20.0 or 25.0 mL . At our school we use Diji pipettes. <br> Make sure you are familiar with the type of pipette that you will use in your assessment. <br> You rinse a pipette before use with a little of the solution you will be using it with. | Diji example - deliver a 20.0 mL sample into a conical flask | Pipette Techniques - may vary according to the type of pipette you use at your school <br> Keep pipette vertical <br> Use a slow smooth action <br> Have your eye level with the bottom of the meniscus. <br> Touch tip of pipette on side of conical flask at end of delivery. <br> Avoid having unexpected air bubbles when drawing up the liquid. |

## Selecting your data

You are looking for 3 concordant results - i.e. values that differ from each other by 0.10 mL - if not then choose the 3 closest values

| Expt. | rough | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :--- | ---: | :---: | :---: | :---: | :---: |
| Final | 14.00 | 27.20 | 40.60 | 13.60 | 26.90 |
| Initial | 0.20 | 14.00 | 27.20 | 0.00 | 13.60 |
| Volume <br> added <br> $(\mathrm{mL})$ | 13.80 | 13.20 | 13.40 | 13.60 | 13.30 |

In this case a good choice would be to select the following data values: $13.20 \mathrm{~mL}, 13.30 \mathrm{~mL}$ and 13.40 mL

This would give an average titre of $\mathbf{1 3 . 3 0 \mathrm { mL }}$ to use in our calculation.

In this example it is advisable to do another titration can you see why?

| Expt. | rough | $\mathbf{1}$ | $\mathbf{2}$ | $\mathbf{3}$ | $\mathbf{4}$ |
| :--- | ---: | :---: | :---: | :---: | :---: |
| Final | 15.70 | 30.60 | 46.20 | 15.30 | 30.60 |
| Initial | 0.00 | 15.70 | 30.60 | 0.20 | 15.30 |
| Volume <br> added <br> $(\mathrm{mL})$ |  |  |  |  |  |

## Example calculation

Remember that $\mathrm{c}=\mathrm{n} / \mathrm{V}$
$\mathrm{c}=$ concentration in $\mathrm{mol} \mathrm{L}^{-1}$
$\mathrm{n}=$ amount of a substance in mol
$\mathrm{V}=$ volume of solution used in Litres ( L )
Rearrange to give $n=c V$ when required.

## Steps involved

1) Identify the known and the unknown in the problem.
2) Find the amount ( $\mathbf{n}$ ) of the known using the equation $\boldsymbol{n}=\mathbf{c} \mathbf{V}$
3) Look at the balanced equation (always supplied) to find the amount ( $\mathbf{n}$ ) of the unknown reacting
4) From amount ( $\mathbf{n}$ ) and volume (V) of the unknown solution use $\mathbf{c}=\mathbf{n} / \mathbf{V}$ to find the concentration of the unknown in $\mathrm{mol} \mathrm{L}^{-1}$

To convert mL to L divide by 1000 or multiply by $10^{-3}$ e.g. $18.0 \mathrm{~mL}=18.0 \times 10^{-3} \mathrm{~L}$ Don't forget to do this!

Eg 20.0 mL of unknown concentration of $\mathrm{NaOH}(\mathrm{aq})$ was reacted with 10.0 mL of a solution of $0.150 \mathrm{~mol} \mathrm{~L}^{-1} \mathrm{HCl}(\mathrm{aq})$ Equation $\mathrm{NaOH}+\mathrm{HCl} \longrightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}$

1) Known $=\mathrm{HCl}$ and unknown $=\mathrm{NaOH}$
2) $\mathrm{n}(\mathrm{HCl})=\mathrm{cV}=0.150 \mathrm{~mol} \mathrm{~L}^{-1} \times 10.0 \times 10^{-3} \mathrm{~L}$ $=1.50 \times 10^{-3} \mathrm{~mol}$ of HCl reacted
3) ratio $\mathrm{HCl}: \mathrm{NaOH}=1: 1$ so $\mathrm{n}(\mathrm{NaOH})$ is also $1.50 \times 10^{-3} \mathrm{~mol}$ reacted
4) $\mathrm{c}(\mathrm{NaOH})=\mathrm{n} / \mathrm{V}=1.50 \times 10^{-3} \mathrm{~mol} / 20.0 \times 10^{-3} \mathrm{~L}$ Answer $=0.0750 \mathrm{~mol} \mathrm{~L}^{-1}$ (3 s.f.)

For achievement of the standard:

- at least three recorded titre values must fall within a range of 0.4 mL ; the average titre value must be within 0.8 mL of the teachers answer.
- solving quantitative problems that use the relationships $n=m / M$ and $c=n / V$ to calculate one variable given the other two (the relationships are not given). Molar masses for substances may be provided. Calculations must be carried out using appropriate procedures (not provided).

## For achievement with merit

- at least three titre values must fall within a range of 0.4 mL ; the average titre value must be within 0.5 mL of the expected outcome.
- solving quantitative problems that involve at least two steps and require application of relationships such as $n=m / M$ and $c=n / V$. Titration calculations must be carried out correctly using only concordant titre values.

## For achievement with excellence:

- at least three titre values must fall within a range of 0.2 mL ; the average titre value must be within 0.2 mL of the expected outcome.
- solving quantitative problems that involve more than two steps, and the use of stoichiometric principles. Answers to calculations must demonstrate correct units and appropriate use of significant figures.

## Quantitative analysis involves collecting primary data from an

 acid-base titration, and processing both primary and secondarydata to solve quantitative problems.

- The standard solution to be used in the titration may be provided. The titration procedure and balanced equations will be provided.
- Student selected data will be used in determining the accuracy of the titration.
