

**Assessment Schedule – 2022 Final****Chemistry: Demonstrate understanding of the properties of selected organic compounds (91165)****Evidence**

Q	Evidence	Achievement	Merit	Excellence						
ONE (a)(i)	<table border="1"> <thead> <tr> <th>Primary alcohol</th> <th>Secondary alcohol</th> <th>Tertiary alcohol</th> </tr> </thead> <tbody> <tr> <td>B or D</td> <td>A or C</td> <td>E</td> </tr> </tbody> </table>	Primary alcohol	Secondary alcohol	Tertiary alcohol	B or D	A or C	E	<ul style="list-style-type: none"> <li>• 2 / 3 correct.</li> </ul>	<ul style="list-style-type: none"> <li>• 2 / 3 correct.</li> </ul>	
Primary alcohol	Secondary alcohol	Tertiary alcohol								
B or D	A or C	E								
(ii)	This alcohol is classified as secondary because the carbon atom that is attached to the OH functional group is bonded to two other carbon atoms.	OR Correct explanation.	AND Correct explanation.							
(iii)	Constitutional isomerism indicated. <i>Constitutional isomers</i> are compounds with the same molecular formula, but different structural formulas. Both compounds have the molecular formula of C <sub>5</sub> H <sub>10</sub> O, but they have a different connectivity of atoms. Compound B is an alkene while Compound C has a cyclic structure.	<ul style="list-style-type: none"> <li>• Correct choice and definition.</li> </ul> OR Correctly ruled out geometric isomerism	<ul style="list-style-type: none"> <li>• Correct type of isomerism with explanation linked to structures.</li> </ul>							
(b)	Compound C reacting with bromine water will be a slow reaction, requiring UV light as a catalyst. This is a substitution reaction, where the H on one carbon is substituted by a Br atom. The bromine water will decolourise from a red brown / orange / brown / yellow colour. When the other compounds react with bromine water, it is a fast reaction. This is an addition reaction, where the double bond is broken, and two Br atoms are added. The bromine water decolourises from a red brown / orange / brown / yellow colour.	<ul style="list-style-type: none"> <li>• Identifies the two types of reaction occurring.</li> <li>• States the correct colour change.</li> </ul>	<ul style="list-style-type: none"> <li>• Explains the type of reaction linked to observations for Compound C or one of the other compounds.</li> </ul>	<ul style="list-style-type: none"> <li>• Full explanation of reaction linked to observations for Compound C or the other compounds and attempts a comparison between the two</li> </ul>						

(c)(i)	From Compound F:		<ul style="list-style-type: none"> <li>• Correct structure(s) for product(s) from ONE compound (major / minor can be incorrectly assigned).</li> </ul>	<ul style="list-style-type: none"> <li>• Explains major and minor products but missing aspects of explanation. AND Correct structures</li> </ul>	<ul style="list-style-type: none"> <li>• Full explanation of how to identify the major and minor products. AND Correct structures.</li> </ul>
	$\text{CH}_3-\text{CH}=\text{CH}-\text{CH}_2-\text{CH}_3$	$\text{CH}_2=\text{CH}-\text{CH}_2-\text{CH}_2-\text{CH}_3$			
	Major product	Minor product			
(ii)	From Compound G: $\text{CH}_3-\text{CH}=\text{CH}-\text{CH}_2-\text{CH}_3$		<ul style="list-style-type: none"> <li>• States there are two ways that <math>\text{H}_2\text{O}</math> can be eliminated.</li> </ul>	<ul style="list-style-type: none"> <li>• Links symmetry or asymmetry of alcohol to number of reaction products.</li> </ul>	<ul style="list-style-type: none"> <li>• Full explanation of why a different number of products are formed.</li> </ul>
	<p>Compound F is asymmetric about the alcohol group. This means two different products form, depending on which neighbouring carbon the hydrogen atom is eliminated from. The major product is formed when the OH group is eliminated, along with a hydrogen atom from the neighbouring carbon bearing the least number of hydrogen atoms. This is C3 as it is only bonded to 2H's while C1 is bonded to 3 H's. This produces pent-2-ene as the major product and pent-1-ene as the minor product.</p> <p>Compound G is a symmetrical alcohol, meaning only one product is formed, regardless of which neighbouring carbon the hydrogen atom is eliminated from, resulting in pent-2-ene.</p>				

NØ	N1	N2	A3	A4	M5	M6	E7	E8
No response; no relevant evidence.	1a	2a	3a	4a	3m	4m	2e (minor error/omission)	2e

Q	Evidence	Achievement	Merit	Excellence
<p>TWO (a)(i)</p> <p>(ii)</p> <p>(iii)</p>	<p>Compound D</p> <div style="display: flex; justify-content: space-around; align-items: center;"> <div style="text-align: center;"> <math display="block">  \begin{array}{c}  \text{OH} \\    \\  \text{H}_2\text{C}-\text{CH}_2-\text{CH}_3 \\    \\  \text{C}=\text{C} \\    \quad   \\  \text{H} \quad \text{H} \\  \textit{cis}  \end{array}  </math> </div> <div style="text-align: center;"> <math display="block">  \begin{array}{c}  \text{OH} \\    \\  \text{H}_2\text{C}-\text{CH}_2-\text{H} \\    \\  \text{C}=\text{C} \\    \quad   \\  \text{H} \quad \text{CH}_3 \\  \textit{trans}  \end{array}  </math> </div> </div> <p>Compound D forms cis / trans isomers, as it has both requirements for geometric isomerism. It contains a C=C double bond, which prevents rotation of atoms about the bond. Compound A also has this. However, the second requirement is that each carbon of the double bond is bonded to two different atoms or groups. Compound A doesn't meet this requirement, as one of the carbons has two hydrogen atoms attached. In Compound D, one of the carbons of the double bond has a hydrogen atom and a methyl group, while the other has a hydrogen atom and a CH<sub>2</sub>CH<sub>2</sub>OH group, which can be arranged differently in space, forming geometric isomers.</p>	<ul style="list-style-type: none"> <li>• Correct compound and isomers.</li> </ul> <ul style="list-style-type: none"> <li>• States the two requirements for geometric isomerism.</li> <li>• Identifies double bond restricts rotation</li> </ul> <p>OR</p> <ul style="list-style-type: none"> <li>• Identifies two groups.</li> </ul>	<ul style="list-style-type: none"> <li>• Explains why the double bond is required for geometric isomerism</li> <li>• Explains why each C on the double bond must have two different atoms or groups on them.</li> </ul>	<ul style="list-style-type: none"> <li>• Justifies why Compound D forms geometric isomers while compound A doesn't.</li> </ul>
<p>(b)(i)</p> <p>(ii)</p>	<div style="text-align: center;"> <math display="block">  \begin{array}{c}  \text{H}_2\text{C}-\text{OH} \quad \text{H}_2\text{C}-\text{OH} \\    \quad \quad   \\  \text{CH}_2 \quad \quad \text{CH}_2 \\    \quad \quad   \\  \text{CH}_2 \quad \text{H} \quad \text{CH}_2 \quad \text{H} \\  \left( \begin{array}{cccc}   &amp; - &amp;   &amp; - &amp;   &amp; - &amp;   \\ \text{C} &amp; &amp; \text{C} &amp; &amp; \text{C} &amp; &amp; \text{C} \\   &amp; &amp;   &amp; &amp;   &amp; &amp;   \\ \text{H} &amp; &amp; \text{H} &amp; &amp; \text{H} &amp; &amp; \text{H} \end{array} \right)_n  \end{array}  </math> </div> <div style="text-align: center;"> <math display="block">  \begin{array}{c}  \text{H}_2\text{C}=\text{CH}-\text{CH}_2-\text{CH}_2-\text{CH}_2-\text{CH}_2-\text{OH} \xrightarrow{\text{HCl addition}} \begin{array}{c} \text{Cl} \quad \quad \text{OH} \\   \quad \quad   \\ \text{H}_2\text{C}-\text{CH}_2-\text{CH}_2-\text{CH}_2-\text{CH}_2-\text{CH}_2-\text{OH} \\ \text{minor} \end{array} \quad \begin{array}{c} \text{Cl} \quad \quad \text{OH} \\   \quad \quad   \\ \text{H}_3\text{C}-\text{CH}-\text{CH}_2-\text{CH}_2-\text{CH}_2-\text{OH} \\ \text{major} \end{array} \\  \text{Compound B} \\  \downarrow \text{KOH (alc) elimination} \\  \begin{array}{c} \text{H}_3\text{C}-\text{CH}=\text{CH}-\text{CH}_2-\text{CH}_2-\text{OH} \\ \text{major} \end{array} \quad \begin{array}{c} \text{H}_2\text{C}=\text{CH}-\text{CH}_2-\text{CH}_2-\text{CH}_2-\text{OH} \\ \text{minor} \end{array} \\  \text{Compound D}  \end{array}  </math> </div>	<ul style="list-style-type: none"> <li>• Correct polymer.</li> </ul> <ul style="list-style-type: none"> <li>• Identifies that atoms needs to be added but uses incorrect reagent.</li> </ul> <p>OR</p> <ul style="list-style-type: none"> <li>• Both reaction types identified.</li> </ul> <p>OR</p> <ul style="list-style-type: none"> <li>• Major and minor products identified for one step (can have error in reagent).</li> </ul>	<ul style="list-style-type: none"> <li>• One step fully correct with major and minor products identified.</li> </ul> <p>OR</p> <ul style="list-style-type: none"> <li>• Both reagents in correct order.</li> </ul>	<ul style="list-style-type: none"> <li>• Correct process to form compound D with major and minor products and reaction types fully identified.</li> </ul>
