

<p>Method 1</p>  <p>Collect the gas given off in a syringe. Record mL of gas / time.</p>	<p><b>Changing concentration</b></p> <p>If the solution e.g. the acid, is more concentrated there are more acid particles/volume.... so there will be more particle collisions / time e.g. between the acid and metal ..... and so the rate of reaction will increase.</p>	<p><b>Changing surface area</b></p> <p>If the surface area of a solid is increased there are more particles immediately available / exposed for collision .... so there will now be more particle collisions/time..... and so the rate of reaction will increase.</p>	<p>The three examples (methods 4-6) are NOT strictly measuring rate (which is an amount / time) as they measure the time for a “whole event” to occur, but never the less they are still useful to allow for comparisons of “rate”.*</p>	<p>Method 4</p>  <p>Time until the colourless solution changes colour e.g. colourless to purple or blue. Record time (for the event).</p>	
<p>Method 2</p>  <p>Collect gas given off in an upturned measuring cylinder &amp; measure using the scale markings. Record mL of gas / time.</p>	<p><b>Changing temperature</b></p> <p>If the temperature is increased the particles (of the liquid) have greater kinetic energy – move faster .... so there are more collisions/time... and so the rate of reaction will increase. Since the particles have more energy more of the collisions are successful collisions (have enough energy for a reaction to occur).</p>	<p><b>Rates of reaction revision.</b></p> <p>Rates increase or decrease. 😊</p> <p>They don't get longer or shorter (that's the times!) 😊</p> <p>Rates don't get quicker or slower – (that's the reactions) 😊</p>	<p>The student could vary</p> <ul style="list-style-type: none"> <li>• Concentration of one of the solutions</li> <li>• Temperature of the solutions</li> <li>• Addition of same amount of different catalysts</li> <li>• Surface area of the solid (method 6 only).</li> </ul> <p>*You should plot time data as 1/T but we don't usually do this at level 1.</p>	<p>Method 5</p>  <p>Time until the colourless solution becomes so cloudy that an X cannot be seen. Record time (for the event).</p>	
<p>Method 3</p>  <p>Let the gas produced escape &amp; measure the decrease in mass on a balance. The decrease in mass = mass of gas that escaped. Record g of gas / time.</p>	<p>Examples for method 3:</p> $\text{CaCO}_3 + 2\text{HCl} \rightarrow \text{CaCl}_2 + \text{H}_2\text{O} + \text{CO}_2$ $\text{Zn} + \text{H}_2\text{SO}_4 \rightarrow \text{ZnSO}_4 + \text{H}_2$ <p>The student could vary</p> <ul style="list-style-type: none"> <li>• Concentration of acid, OR</li> <li>• Surface area of calcium carbonate (marble chip), OR</li> <li>• Temperature of the acid</li> </ul> <p>Note: Not so good a method for reactions making H<sub>2</sub> as H<sub>2</sub> is such a light gas that the mass changes are very, very small.</p>			<p>Examples for method 6:</p> $\text{CaCO}_3 + 2\text{HCl} \rightarrow \text{CaCl}_2 + \text{H}_2\text{O} + \text{CO}_2$ $\text{Mg} + \text{H}_2\text{SO}_4 \rightarrow \text{MgSO}_4 + \text{H}_2$ <p>The student could vary</p> <ul style="list-style-type: none"> <li>• Concentration of acid, OR</li> <li>• Surface area of calcium carbonate OR Mg</li> <li>• Temperature of the acid</li> </ul> <p>Note: Do NOT say time until the reaction stops – say time until the reaction is complete!! CaCO<sub>3</sub> or Mg has all “dissolved”** i.e. cannot be seen. ** The stuff doesn't really dissolve – it reacts to make soluble substances you can't see.</p>	<p>Method 6</p>  <p>Time until the piece of metal / piece of tablet completely disappears (all has reacted). Record time (for the event). Again the stuff doesn't really dissolve – it reacts to make soluble substances you can't see.</p>
